Example of Plotting or Measuring Bearings on the Map

Using Magnetic North as the North Reference

In this example the bearing is 70° Magnetic

- Rotate the compass dial so that 70° is at the index line.
- We're not using the magnetic needle in our compass.
- Instead we are aligning the parallel lines, in the compass capsule, with the Magnetic North reference lines on the map.

(The Magnetic North angle has been exaggerated for clarity)

Folding and cutting instructions

#1 Turn the sheet over, fold in half on the dotted line, so the letter "A's touch.

#2 Fold the sheet in half again on the #2 fold line, so the letter "B's touch.

#3 Cut the sheet using the marks at the #3 cut line.

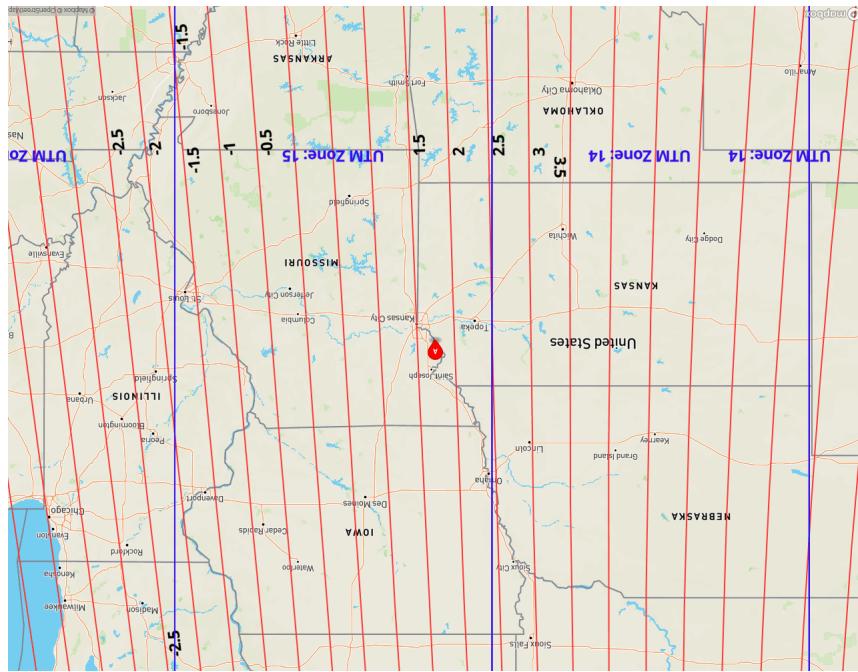

#4 Cut the sheet using the marks at the #4 cut line.

Compass and Map Plotting
both use Magnetic North.
No conversion is required.

Magnetic Bearing to Map (G)
Grid = Magnetic Bearing + 2.7°

Map (G) to Magnetic Bearing
Magnetic Bearing = Grid - 2.7°

Local Magnetic Anomalies

In some areas there may be significant localized magnetic fields typically caused by magnetic rock deposits such as iron ore or lava flows. 3-4 degrees of anomalous declination is common near these areas. In extreme cases a compass may be rendered useless.

It is a good idea to confirm the local declination by comparing compass sighted and map plotted bearings between two known points.
